

Truss Jibs

Truss Jib - Truss jib's can actually be used to carry, transport and position trusses. The attachment is designed to perform as an extended jib attachment along with a pyramid or triangular shaped frame. Normally, truss jibs are mounted on machinery like a compact telehandler, a skid steer loader or even a forklift utilizing a quick-coupler accessory.

Older style cranes that have deep triangular truss jibs are most often assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are seldom any welds on these kind jibs. Every bolted or riveted joint is prone to rust and therefore needs frequent upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This particular design causes narrow separation between the flat exteriors of the lacings. There is little room and limited access to clean and preserve them against rusting. Numerous bolts loosen and corrode in their bores and must be replaced.
